

For

Water Engineering

Blackdown Environmental offer cost-effective solutions to some of the most complex aquatic problems, helping to protect and restore our waterways.

Our clients range from private waterway owners who are re-sponsible for smaller stretches of water, to clients who manage much larger expanses such as canals and watercourses.

We use a combination of specialist machinery and skilled project management to carry out a high standard of aquatic works. We can offer advice and assistance on a range of maintenance and restoration-related issues, and are experienced in working in the most environmentally sensitive areas.

Following the principles of bio-engineering, or soft engineering, we use natural products such as willow spiling, hazel fascines and chestnut stakes to achieve cost-effective results, whatever your requirements.
